

VIRTUAL SERVICES

Virtual services are being utilized in many ways, not only for patient convenience but also to develop comprehensive services. We can help you use virtual services to create patient access points and enhance your ability to efficiently and effectively provide services in all levels of care.

Every relationship established by the Mary Free Bed Advisory Group begins with an assessment of your needs and a collaborative discussion of priorities, goals and next steps. We customize solutions and our relationship.

PATIENT ACCESS SERVICES

Connect with your patients at any level of the continuum, virtually anywhere. We understand how important patient access points are to prevent further injury or illness and get patients the help they need at the right time and place.

Our virtual care platforms leverage your ability to connect and engage with patients throughout the continuum of care by:

- Extending consult services and reducing time traveling between locations
- Improving efficiency with your preadmission screening processes for inpatient rehabilitation to facilitate the best patient placement
- Bridging gaps in provider resources and specialty coverage

READMISSION REDUCTION

Hospital readmissions are costly. Our virtual care platforms enable your team to connect with patients when they have questions after going home and guide them through their discharge care plan.

EDUCATION

Our virtual care technology gives patients access to vital educational information to understand and manage their conditions.

CARE TRANSITIONS

Ensuring adequate communication with patients as they move from acute care to post-acute care is vital for providers whose patients participate in bundles. Equally important is leveraging the ability of your clinicians to make effective and efficient transitions across the continuum. Our virtual care platform improves your care transition process, enhances patient engagement and supports better outcomes.
